

THE OIL & PROCESS WATER SPECIALISTS

## OIL POLISHING CANISTER (OPC)

AS THE NAME SUGGESTS THE 'OIL POLISHING CANISTER' IS PRIMARILY USED FOR POLISHING C10 – C20 AND UP, OF THE HYDROCARBON CHAIN.

This filter is capable of flows up to 75 litres per minutes. It contains 15 kilograms of our Oil Adsorbent Granules (OAG). Each kilogram holds between 5 to 10 kilograms of oil. The top 6 bags are exposed to the oily water (this gives an oil holding capacity of up to 30 to 60 kilograms before the need to service).

Servicing is very quick, just removing the lid and exchanging the bags. Our specially fitted pressure relief valve activates at 3psi and indicates the need for servicing or maintenance.

Air compressor condensate, most oils, fats and greases can be polished with this unit.
